

PROMOSOLV™ 9000

Specialty fluid for ultrasonic motion picture film cleaning

INTRODUCTION

Inventec developed in cooperation with Media Migration Technology (previously Lipsner Smith Company) PROMOSOLV 9000, a cleaning fluid dedicated for motion film cleaning.

Organizations, such as film archives, libraries and owners of valuable film collections –and those who serve them– need to clean precious and sometimes damaged motion picture film. This is a critical part of a successful digitization and restoration workflow. There is no better option than ultrasonic cleaning in a deep tank design to provide the highest standards of film digitization.

DROP IN REPLACEMENT

It's a drop-in replacement for trichlorethylene, NPB and other solvents with a high Health, Safety & Environmental impact. While reducing substantially the HSE impact, the cleaning performance is at an equivalent level. Besides, it's a like for like substitute for the phased out 3M Novec™ 8200 and 7200 as it has the same proportion of components and same properties.

KEY FEATURES

Compatible

PROMOSOLV 9000 is compatible with most film materials and materials used in specialised ultrasonic motion film cleaning equipment. When in doubt, we can test compatibility of specific materials on request.

Low cost of ownership

The relative high boiling point minimizes solvent drag, limiting consumption. Furthermore, this product can be returned to us for recycling, reducing waste collection cost substantially.

Safe & sustainable

PROMOSOLV 9000 is non-flammable, has a very low GWP, no Ozon Depletion Potential (ODP) and PFOA & PFOS free.
